Crop Reporting Districts

THE 1953 CROP SEASON

Indiana crop yields for 1953 were 110 percent of the 1942-51 averages, weighted by the harvested acreages. No major crop made a yield lower than average. Winter wheat at 28 bushels per acre made a new record yield. Pasture was above average until June but then declined continuously to the end of the season. The cumulative pasture condition of 74 was 86 percent of average.

The fall of 1952 was below normal in precipitation and the deficiency continued through February of 1953. There was sufficient moisture for the germination of fall sown grains. The temperatures in the winter were about 2 degrees above normal with little extremely cold weather.

March brought more than normal precipitation and above average temperatures giving fall grains and grass a good start. Some oats were seeded the last of March. April was nearly normal in precipitation but below normal temperature by about 5 degrees. This was very favorable for wheat but slowed pasture growth. May was slightly below normal in rainfall and slightly above in temperature. Planting of corn and soybeans made rapid progress. June was also slightly warmer than normal with a little less than normal rainfall. It was a good month for haying and the beginning of small grain harvest in the south.

July was slightly wet with near normal temperatures. Wheat harvest was hindered but little loss resulted. Most crops made excellent progress, except in a few southwest counties where drought was acute in areas missed by showers. August had heavy rains the first week, followed by 2 weeks of cooler than normal weather. This was an excellent growing time for crops, except in some southern counties where the rainfall was lighter. From August 6 to October 20 each week was below normal in precipitation. While there were few extremely hot days, and minimum temperatures were rather consistently below normal, the corn and soybean crops were forced to maturity with some impairment of yield. The hastened maturity of corn and soybeans brought an unusually early start of harvesting operations, the continuance of subnormal precipitation, and above normal temperature to December 1, resulted in an early completion of harvest, with moisture content of both soybeans and corn at exceptionally low levels.

Corn yields were unusually variable. Many fields in the southwest made very low yields and below average yields were also found in the northwest. Some very high yields were secured in the central part of the state. The state average was 51.5 bushels.

Winter wheat consistently made yields far above average throughout the state.

Oats started rather slowly and made yields only slightly above average. Barley and rye yields were better than those of most other crops this season.

Soybean yields were lowered by the summer drought, which limited filling and reduced the size of beans. Improved varieties still resulted in a yield above average, or 21.0 bushels per acre.

The acreage of lespedeza hay was reduced from intentions by drought. This reduction of lower yielding acreage contributed to making the state

yield of all hay higher than average. The 1.43 tons per acre resulting in production of 2,485,000 tons only 15,000 less than last year.

Sizes of fruits were limited by drought, so prospects declined toward the end of the growing season. Production was less than average.

Processing crops all made better than average yields. Tomatoes at 9.0 tons per acre were especially high. The dry picking season reduced rot and permitted exceptionally complete harvesting.

Fresh market vegetable crop yields were below many major crops. Only watermelon yields were definitely above average.

The fall of 1953 was rather similar to that of 1952. Winter wheat seeded on plowed ground came up to good stands and a good start. Following soybeans wheat came up rather slowly and somewhat unevenly. Condition December 1 was lower than average because of limited growth. With the dry fall the prospective yield is again high. The acreage of wheat seeded is 77 percent of the previous year reflecting the acreage allotments as well as reaction to the lowered price of wheat.

Seeding of rye, for all purposes was 160 percent of last year, reflecting the need of early pasture, especially in drought areas.

LIVESTOCK SUMMARY JANUARY 1, 1953

INDIANA

Crop Reporting Districts

During 1952, Indiana numbers of all cattle and stock sheep increased while the numbers of hogs, horses, and mules declined. Milk cow numbers in Indiana as of January 1 were estimated to be the same as a year earlier.

For the fourth successive year, all cattle numbers showed an increase. In 1952, this increase amounted to 8 percent, and was accounted for by higher beef cattle numbers. The number of milk cows, which had been declining for 7 years, appears to have stabilized at 671,000, the same as last year's number. Stock sheep numbers were 10 percent higher on January 1 than a year ago.

There were 9 percent less hogs by the end of the year than at the beginning. Horse numbers declined another 13 percent during the year, and mule numbers were down 10 percent from a year ago.

Farm chickens, January 1, numbered about 2 percent higher than the year previous. The increase is accounted for by more pullets, since other farm chickens were fewer in number than the year before. Turkey breeding stock showed a decrease of 8 percent during the year.

Values per head decreased sharply for all meat animals, poultry, and milk cows. The percentage decline by species is as follows: Stock sheep—37; all cattle—24; milk cows—18; hogs—17; farm chickens—10; turkeys—7. Average values per head of work stock on January 1 were higher than a year earlier.

Total inventorial value of all livestock and poultry took a sharp drop from $535,675,000 to $435,044,000, a reduction of 19 percent.

Sheep on feed at 104,000 was 30 percent higher than a year ago. Cattle and calves on feed at 225,000 was 25 percent higher than last year.

The spring pig crop in 1952 amounted to 4,182,000 head, a reduction of 154,000 from the spring crop of 1951. The fall crop was 3,750,000 head, a reduction of 387,000 from the fall crop of 1951. Pigs saved for the year 1952 totaled 7,932,000.

Broilers produced in Indiana in 1952 were estimated at 33,674,000, which is 1 percent less than the number raised in 1951. With an average live weight of 3.2 pounds per bird sold and an average price of 29.8 cents per pound of live weight, the gross income from the 1952 broiler crop was $32,112,000.

The 1952 lamb crop was 321,000 head compared to 301,000 in 1951. The wool clip of 2,850,000 pounds averaged 47 cents per pound for a total value of $1,340,000 compared to $2,515,000 in 1951.

UNITED STATES

Livestock and poultry on farms and ranches showed a net increase of 1 percent during 1952. This was the fourth successive yearly increase, but the aggregate for January 1, 1953 was 12 percent below the peak of January 1, 1944. The increase resulted from a substantial rise in cattle numbers, since the number of all other species was down. Milk cows showed the first increase since 1945. Hog numbers recorded a sharp decrease after having increased each year since 1948. Sheep numbers declined slightly after increasing in each of the two preceding years. The number of chickens and turkeys showed modest decreases, while the number of horses and mules continued the decline that has been in progress for many years.

Feeding activity at the end of the year was at a record level for cattle and calves but lower than a year earlier for sheep and lambs. The second largest corn crop on record and lower prices for feeder cattle stimulated demand for placing cattle on feed in the Corn Belt States, but failure of wheat pastures to develop held down lamb feeding. On January 1, 1953, a record number of cattle and calves was on grain feed for market—16 percent more than a year earlier—but the number of sheep and lambs on feed was down 7 percent. The calf crop, lamb crop and wool production for 1952 exceeded the 1951 output. Commercial broiler output set a new record high as did the number of turkeys raised. A further marked expansion took place in production of Beltsville and other light breed turkeys. Commercial hatchery production was kept at near record activity with the second highest outturn of chicks and a record number of poults hatched.

Hog production reached a postwar peak in 1951, the third largest in history, but the pig crop declined 10 percent in 1952. Farrowings were below 1951 in both the spring and fall seasons. The number of chickens raised on farms was down 7 percent, resulting in 8 percent fewer pullets in farm inventories on January 1, 1953. Dry conditions again forced liquidation of livestock, especially sheep and goats. Drought forced cattle to market in many sections of the Great Plains. While most of these States show more cattle and calves than last January, there are some counties or districts in these States where cattle numbers are down from last year.

Production of feed grains in 1952 was up 7 percent from 1951, and the fifth largest on record. The supply of feed grains on farms on January 1, 1953 per animal unit was about 12 percent above average. Hay supplies per animal unit are down from a year earlier, with many sections of the country experiencing shortages and high prices. Hay has been moved from North Central areas to the South and Southwest where production was lowered sharply by drought.

Even with a slightly larger aggregate number of livestock and poultry, the farm value of 14.9 billion dollars was 24 percent below the record high of 19.6 billion dollars on January 1, 1952, but 29 percent above the 10-year average. January 1 values of all species were lower than a year ago. Declining prices for livestock and poultry were reflected in the January 1 average inventory value. Most marked of all were the declines of 44 percent from a

year earlier in the average value per head for stock sheep and 28 percent in the average value for cattle and calves.

The 93.7 million head of cattle and calves on January 1, 1953, represented an increase of about 6 million head, or 7 percent during 1952. This marks the 4th successive increase in cattle numbers since the recent low point of 76.8 million head on January 1, 1949. The 1953 number exceeds the peak of the previous cycle on January 1, 1945 by over 8 million head. All classes of cattle showed increases. Cattle kept primarily for milk production were the highest since 1947. The biggest increases again took place on the beef side. Beef cows attained a record high of 22.5 million head at the beginning of 1953. Other calves and steers each showed increases of 9 percent. Slaughter of cattle and calves, although 8 percent above 1951, was smaller than for any other year since 1943. The increase in inventories was supported by a record high calf crop in 1952 and a relatively small slaughter of cattle and calves in relation to the high inventories. Imports of cattle from Canada totaled less than 13,000 head since no imports were permitted after the quarantine was imposed in February 1952. The quarantine on Mexican imports, which had been in effect since 1946, was lifted in September 1952 and 128,000 head were imported by the end of the year.

Th 2-year rise in sheep inventories which began in 1950 was brought to a halt in 1952 when numbers declined 477,000 head. Most of the decrease was in the number of sheep and lambs on feed which dropped 7 percent. Stock sheep and lambs estimated at 27.9 million head, were down 193,000 head from last year, or about 1 percent. Total slaughter of sheep and lambs was sharply higher in 1952 than the record low of 1951. Increased slaughter in 1952 resulted from a larger number on feed at the beginning of 1952 and the slaughter of a much larger proportion of the 1952 lamb crop. While the 1952 lamb crop was up slightly from 1951, it was not large enough to maintain stock sheep inventories, considering the increase in slaughter. The Texas sheep country suffered from drought conditions for the second straight year and the sharp decline in that State, together with declines in several northwestern States, was enough to more than offset the general increase which took place in the native sheep States.

Hog numbers declined sharply and were down 14 percent from a year earlier. The January 1, 1953 inventory number totaled 54.6 million head, a decrease of almost 9 million head. The decrease in hog numbers resulted from a sharp drop in the 1952 pig crop. Slaughter during 1952 was 2 percent larger than in 1951. This resulted from the larger holdings at the beginning of the year and a larger proportion of the 1952 pig crop being slaughtered before the end of the year. Hogs under 6 months of age showed a decrease in line with the smaller fall pig crop, but the number over 6 months old was down 16 percent. The sharply smaller inventory of breeding stock reflects the intentions to reduce 1953 spring farrowings. With few exceptions all areas of the country showed lower hog inventories on January 1, 1953 than a year earlier. All the Corn Belt States were down, with a total decrease of 14 percent. Iowa hog numbers were 11 percent smaller than last January; Illinois was off 9 percent; and Nebraska, 26 percent.

Horse and mule numbers continued a rapid rate of decline.

Chickens on farms January 1, excluding commercial broilers, were down 4 percent from a year ago and 12 percent below the 1942-51 average. Pullets were down 8 percent following a 7 percent smaller chicken crop in 1952, while the number of hens increased 5 percent. Turkey inventories on farms January 1 decreased 8 percent and breeder hens decreased 10 percent.

Miner M. Justin, Robert E. Straszheim, Byron R. Bookhout, Eugene H. Carter
